Dammam, Saudi Arabia (Transferable Iqama) · Citizenship: India · Driving License Available

PROFESSIONAL SUMMARY

Business Analyst with a backend engineering background (Java, Spring Boot, Python) leading requirements, system design, and delivery across a logistics SaaS migration and an indie game studio. Currently defining the requirements, data model, and access-control design behind Gulf Loads' internal-tool-to-multi-tenant-SaaS migration, and running product/BA for Aurelio Game Studio end to end — from UI/UX requirements and store-compliance specs to business registration and vendor evaluation. I come from a coding background, so I write the technical specs myself instead of just handing requirements off.

EXPERIENCE

Business Analyst | Gulf Loads · Dammam, Saudi Arabia (On-site)

Jul 2026 – Present

- Reviewed logistics workflows across client onboarding, supplier sourcing, route assignment, and load tracking (run entirely on manual tracking), then gathered requirements and translated freight coordination logic — multi-truck loads, trade routes, client-supplier relationships — into data models the team could actually use.
- Defined the phased delivery plan (internal admin-provisioned slice vs. self-service tenant signup slice) and role-based access control / tenant-isolation requirements as the platform moved toward multi-tenant SaaS, and evaluated payment processor options for its billing model.
- Own system architecture, data import/export standards, and reporting requirements myself, writing the technical specs rather than handing them off to a separate engineering team.
- Built Excel-based import templates and entity relationship models to standardize how load, driver, and route data gets captured and migrated, covering a growing network of 6 clients and 15 truck suppliers.

Business Analyst | Aurelio Game Studio · Remote

Nov 2025 – Present

- Founded Aurelio Game Studio and built it from an idea into an active studio, setting strategy, product roadmaps, and team structure across development, art, and design — including business registration/compliance (UDYAM, MCA SPICe+ evaluation) and the founders' equity structure (DVR/SVR shares, ESOP, vesting).
- Drove requirements and UI/UX specification for a new mobile title, defining the full screen set needed to pass iOS/Play Store submission and ad-network approval, and coordinated with design/UI contributors to deliver it.
- Authored the studio's privacy policy and terms & conditions to generically cover current and future titles, and scoped a licensing opportunity to bring a third-party puzzle game to mobile.
- Run requirements gathering across developers, artists, and designers, prioritize features against gameplay goals and release timelines, then assign tasks and track deliverables to keep milestones on schedule.
- Defined the requirements and performance targets behind Poly Overtake, a mobile racing game that shipped to Google Play with zero critical defects after launch (including AdMob/GPGS SDK integrations and OAuth flows), and defined the fix for a rendering bottleneck that cut draw call batches from 3,000 to 81 (97% reduction).

Backend Support Engineer (Contract) | MINE · Remote, USA

Apr 2025 – Jan 2026

- Traced and documented root causes for 18 recurring production backend issues, then tracked fixes through Agile sprint cycles, and built automated API test pipelines in Java and Postman wired into the team's CI/CD workflow.
- Defined API contract standards for 20 Spring Boot endpoints (request validation, response schemas, error handling), which cut down support escalations, and worked Agile standups with frontend and QA to align contracts and catch mismatches before production.

EDUCATION

B.Tech, Computer Science and Engineering · VIT Vellore (Vellore Institute of Technology), India | 2021 – 2025

KEY PROJECTS

- Mirfak Ops** (React/Vite, Express, Prisma, PostgreSQL, Capacitor Android). Multi-tenant logistics operations and invoice management SaaS built end to end, running with Gulf Loads as its first tenant. Multi-truck load tracking with client/supplier pricing, payment status and profit calculation; drag-and-drop route builder with MapLibre visualization; Excel import pipeline with fuzzy column matching and alias-driven entity merging; server-side role-based permissions; bilingual (EN/AR) automated reminders; tenant isolation via a Prisma client extension, covered by an automated cross-tenant test in CI.
- Crash Detection System** (YOLOv8, OpenCV, Python). Hit 97.5% accuracy and 98.5% precision with multiframe validation, plus automated WhatsApp, SMS, and call alerts on confirmed crash events.

SKILLS

Business Analysis: Requirements Gathering · Process Analysis · Data Modeling · Stakeholder Management · Solution Design · Phased Delivery Planning · RBAC Requirements · Vendor Evaluation · Business Registration & Compliance · Product Roadmapping · Power BI · SQL · Excel · Agile/Scrum · Reporting

Technical: Java · Python · Node.js · Spring Boot · REST API · Microservices · Multi-Tenant SaaS · PostgreSQL · Prisma · Docker · CI/CD · Git · AWS/GCP · LLM Integration
